Points to be implemented in Hands on Workshop using Javascript

- As you move your mouse on laptop images, those should get changed, with same company laptop.

- Click on image, which would add a new list item in Order list (available in the cart) with
Cross image + Name of Laptop + Amount.

- **Cross image** in the list item of cart allow you to remove that item from the cart.

- **"Remove all items from cart"** button, will remove all items from the list box but also show one list item in the list box showing information as "You have no items in the cart" (list item with label).

- After clicking on **checkout** button, it should show the section for **submitting username and password.**

- Once **Username** and **Password** are entered and user will click on submit, this would make Ajax request (POST) to the server, by passing data like **username**, **password** and **no of list items** in the cart.

- At server side, restful service getting this data from request object, compare username and password with values as **admin** and **abcd.** respectively, and accordingly return Delivery City Information + Payment Mode as Cash on Delivery. Also at service side, it checks no of list items,
    - If 1 product then give 10% discount,
    - If 2 products then give 20% discount,
    - If 3 or more products then give 30% discount.
